                                                                                                                                                                                                                                                                                                                                                                       IsoId=Q8IU80-2; Sequence=VSP_008379, VSP_008380;
Note=No experimental confirmation available;
TISSUE SPECIFICITY: Liver specific.
SIMILARITY: Belongs to peptidase family S1.
SIMILARITY: Contains 2 CUB domains.
SIMILARITY: Contains 3 LDL-receptor class A domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mouse cDNA sequences.";

It catalyzes the conversion of trypsin en trypsin which in turn activates other proenzymes including chymotrypsinogen, procarboxypeptidases, and proelastases.

CATALYTIC ACTIVITY: Selective cleavage of 6-Lys-[-Ile-7 bond in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      rUNCTION: RESPONSIBLE for initiating activation of pancreatic proteolytic proenzymes (trypsin, chymotrypsin and carboxypeptidase A). It catalyzes the conversion of trypsinogen to trypsin which in turn activates other proenzymes including chymotrypsinogen, procarboxypeptidases, and proelastases.

CATALYTIC ACTIVITY: Selective cleavage of 6-Lys-|-Ile-7 bond in trynsinogen
                                                                                                                                                                                                                                                                                                                                                                                                  TISSUE SP

"The DNA sequence of human chromosome 21.";

Nature 405:311-319(2000).
                          trypsinogen.

I SUBUNIT: Heterodimer of a catalytic (light) chain and a multidomain (heavy) chain linked by a disulfide bond.

SUBCELULAR LOCATION: Type II membrane protein (Probable).

ITSSUE SPECIFICITY: Intestinal brush border.

FINSUE SPECIFICITY: Intestinal brush border.

ITSSUE SPECIFICITY: Intestinal brush border.

INTESTITE COATION: Type II membrane protein (Probable).

INTESTITE SPECIFICITY: Intestinal brush border.

INTESTITE SPECIFICITY: Intestinal brush border.

INTESTITE SPECIFICITY: Intestinal brush border.

INTESTITE SPECIFICITY: Are a cause of enterokinase deficiency characterized by diarrhea and failure to thrive.

INTESTITE SPECIFICITY: Belongs to peptidase family S1.

INTESTITE SIMILARITY: Contains 2 LUL-receptor class A domains.

INTESTITE SIMILARITY: Contains 1 MAM domain.

INTESTITE SIMILARITY: Contains 1 SER domain.
                                                                                                                                                                                                                                                                                                                                                                                                       MEDIINE-94329561; PubMed-8052624;

Rinterokinase, the initiator of intestinal digestion, is a mosaic protease composed of a distinctive assortment of domains.";

Proc. Natl. Acad. Sci. U.S.A. 91:7588-7592(1994).

-I- FUNCTION: Responsible for initiating activation of pancreatic proteolytic proenzymes (trypsin, chymotrypsin and carboxypeptidase A). It catalyzes the conversion of trypsinogen to trypsin which in turn activates other proenzymes including chymotrypsinogen, procarboxypeptidases, and proelastases.

-I- CATALYTIC ACTIVITY: Selective cleavage of 6-Lys-|-Ile-7 bond in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nature

It catalyzes the conversion of trypsinogen to trypsin which in turn activates other proenzymes including chymotrypsinogen, procarboxypeptidases, and proelastases (By similarity).

CATALYTIC ACTIVITY: Selective cleavage of 6-Lys-|-Ile-7 bond in

Cleaves pro-Joetween Arg-122 and Ser-123 (By similarity).
-:- SUBCELIULAR LOCATION: Type II membrane protein.
-:- TISSUE SPECIFICITY: Highly expressed in heart.
-:- SIMILARITY: Belongs to peptidase family S1.
-:- SIMILARITY: Contains 2 frizzled (FZ) domains.
-:- SIMILARITY: Contains 7 LDL-receptor class A dom.
-:- SIMILARITY: Contains 1 SRCR domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SEQUENCE FROM N.A.
